

# ASSESSMENT OF Special Students' Needs

## ABSTRACT

Education is a foundational human right; everyone should acquire it even though they are normal or they are differently-abled. In Pakistan, the admission process for special students, in any academic institute, is very hard and almost impossible as it's immensely difficult to read and interpret their actions. Our target school is a school where students of all main disabilities are enrolled. The crucial problem confronted was that the teachers/staff were entering all the students' data on paper and there was a high chance of losing records. We addressed this problem by making a Management System cum Web Application for the target school where paperwork is minimized to its core and all data is stored in digitalized form.
